EDUCATION

University of Illinois at Chicago, College of Engineering **Chicago, IL**
Bachelor of Science in Computer Science - Concentration in Software Engineering May 2024

- GPA: 3.73 / Major GPA: 3.63
- Honors: Cum Laude, Dean's List (8x), Illinois State Scholar, President's Award Program

WORK EXPERIENCE

Software Engineer **Chicago, IL**
Revenova July 2025 - Present

- Architected a third-party freight exchange integration spanning frontend workflows, backend APIs, database changes, and asynchronous webhook processing to support freight quote negotiations and carrier matching.
- Accelerated fleet-management processing speed by 10x through refactoring Salesforce Apex jobs to use asynchronous event-driven patterns and in-memory caching while preserving backward compatibility.
- Scaled processing for high-density zones (7,500+ locations) by batching reverse-geocoding requests and eliminating redundant API calls, validated across 1,000 simulated trip plans.
- Overhauled core outbound email architecture, enabling ~40 additional email paths and future scalability by implementing feature-flagged Queueable processing, deduplication, and automated failure logging.
- Enhanced system observability across 9 Java microservices by centralizing health-endpoint logic and implementing redacted request/response logging for non-2xx responses, backed by comprehensive unit tests.
- Automated static analysis across 575+ files and scheduled cleanup of 100+ stale DKIM CNAME records using Python, Jenkins, AWS CloudTrail, and Route 53, with dry-run execution and failure notifications.

Freelance AI/ML Developer **Skokie, IL**
Various Projects Focused on LLMs July 2024 - July 2025

- Engineered and optimized prompt templates for large language models (LLMs) to improve output quality.
- Contributed to a 20% increase in LLM response accuracy through extensive testing and iteration.
- Reduced manual processing time by 10+ hours a month by automating workflows.
- Analyzed and debugged model responses, refining both prompts and underlying code to enhance accuracy and relevance.

PROJECTS

Breast Cancer Tumor Classification with Machine Learning

- Achieved 99.5% test accuracy on a 30 feature breast cancer dataset by engineering an optimized, end-to-end machine learning pipeline.
- Evaluated and benchmarked 6 ML architectures (Logistic Regression, SVM, KNN, Neural Networks, Decision Trees, Random Forests) across accuracy, memory usage, and inference latency to identify optimal production trade-offs.
- Improved baseline model accuracy by 10% through optimizing hyperparameter tuning and model stability using Scikit-Learn and GridSearchCV and stratified k-fold cross-validation.
- Implemented preprocessing pipelines for feature scaling, normalization, and missing-value imputation, fitting transformations on training data to prevent data leakage.
- Built and evaluated neural network models with TensorFlow/Keras, analyzing training and validation loss to assess convergence, overfitting, and performance relative to traditional classifiers.

PawPal

- Developed a SaaS platform for animal shelter volunteer coordination, implementing volunteer registration, shift scheduling and selection, and automated notifications.
- Implemented 10+ user-driven features by gathering requirements from 5 animal shelters.
- Enhanced code quality and promoted rapid feedback loops by practicing Extreme Programming (XP) principles, such as pair programming and continuous integration.
- Facilitated transparency and collaboration by utilizing Kanban boards to visualize workflow and track progress.

SKILLS

Technical Skills: C++, C#, C, Java, JavaScript, React, Python, SQL, SOQL, HTML, CSS, Apex
Tools: Git, GitHub, Jenkins, AWS EC2, AWS Route 53, AWS CloudTrail,Salesforce Platform, Salesforce CLI
